EXPERIMENTAL

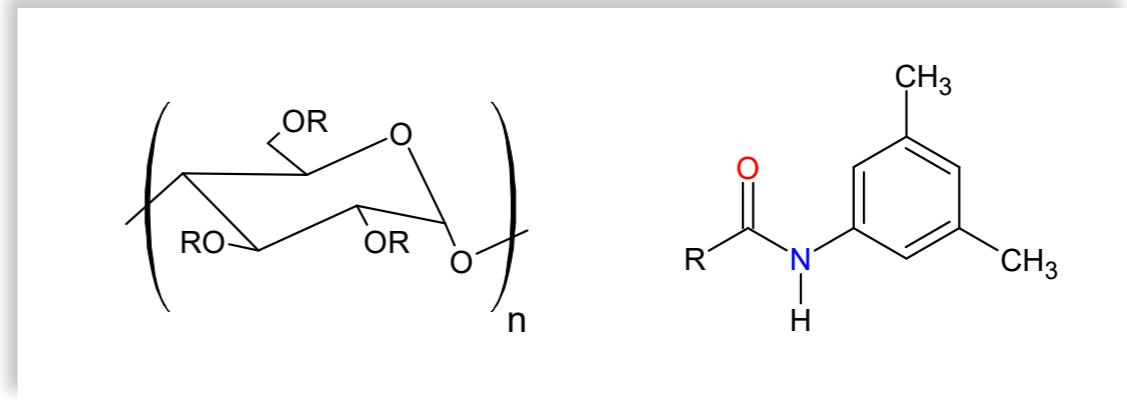

EVALUATION OF REPROSIL CHIRAL OM VS. OD

ReproSil Chiral AM, JM and OM allow similar hit rates as competitor's CSPs.

Evaluation of a silica phase modified with cellulose tris-(3,5-dimethylphenyl- carbamate) „ReproSil Chiral-OM“ in supercritical fluid chromatography. Syame Khater and Caroline West, University of Orleans, CNRS UMR 7311, ICOA.

All experiments were performed on a Jasco SFC system and an Acquity UPC² system. ReproSil Chiral-OM is based on silica coated with tris-(3,5-dimethylphenylcarbamate) of cellulose. Two hundred and thirty achiral compounds and one hundred and thirty chiral racemic compounds were screened on different polysaccharide-type chiral stationary phases in SFC in the following operating conditions: CO₂/MeOH (90:10), flow rate 3 ml/min, oven temperature 25°C, outlet pressure 150 bars.

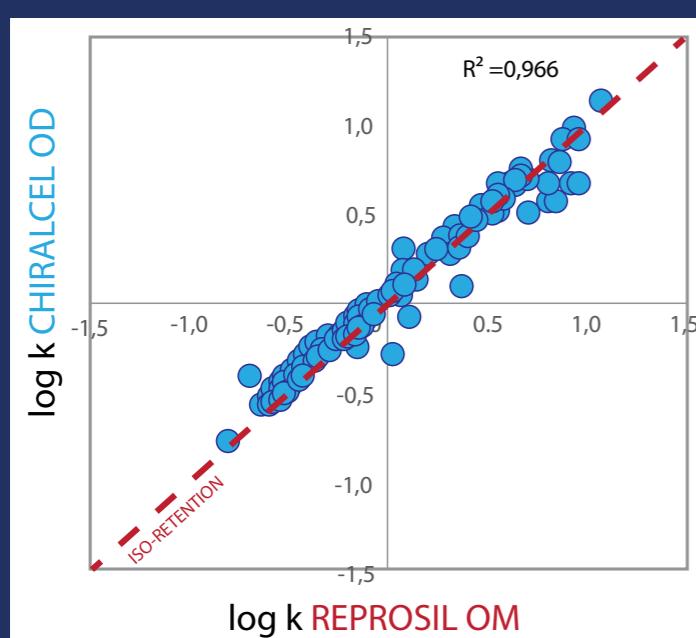

NON-SPECIFIC INTERACTIONS AND RETENTION

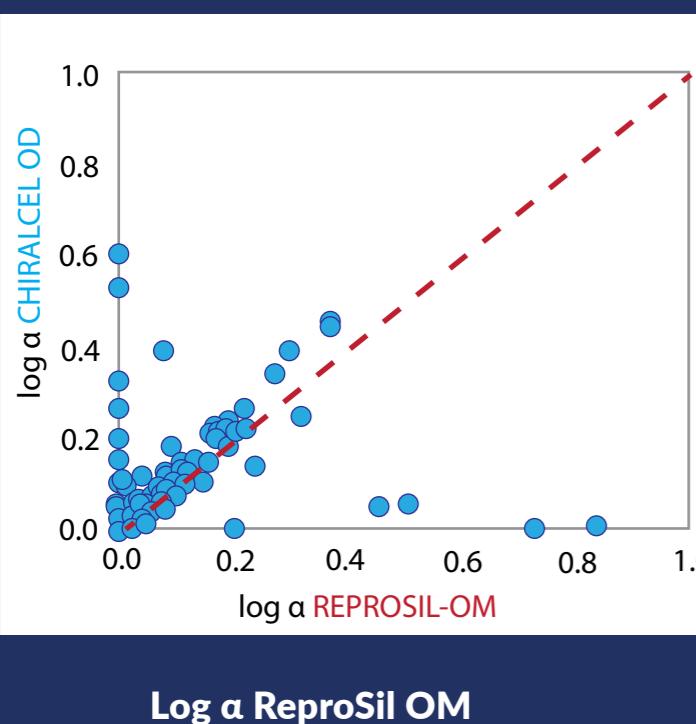

Retention on cellulose tris-(3,5-dimethylphenylcarbamate) could be explained by non-specific interactions such as π-π interactions, hydrogen bonding and stereo-induced interactions.

PERFORMANCE

Log k ReproSil OM

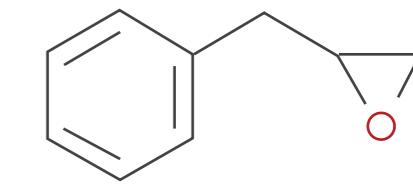

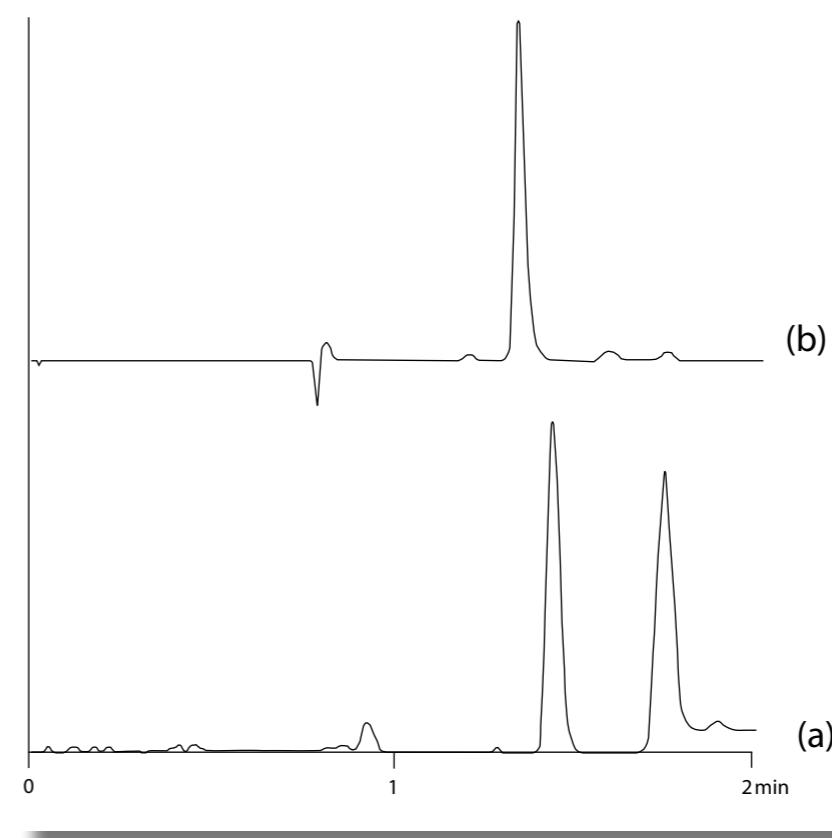

Log a CHIRALCEL OD

APPLICATIONS

All experiments were performed on a Jasco SFC system and an Acquity UPC² system. ReproSil Chiral-OM is based on silica coated with tris-(3,5-dimethylphenylcarbamate) of cellulose. Two hundred and thirty achiral compounds and one hundred and thirty chiral racemic compounds were screened on different polysaccharide-type chiral stationary phases in SFC in the following operating conditions: CO₂/MeOH (90:10), flow rate 3 ml/min, oven temperature 25°C, outlet pressure 150 bars.

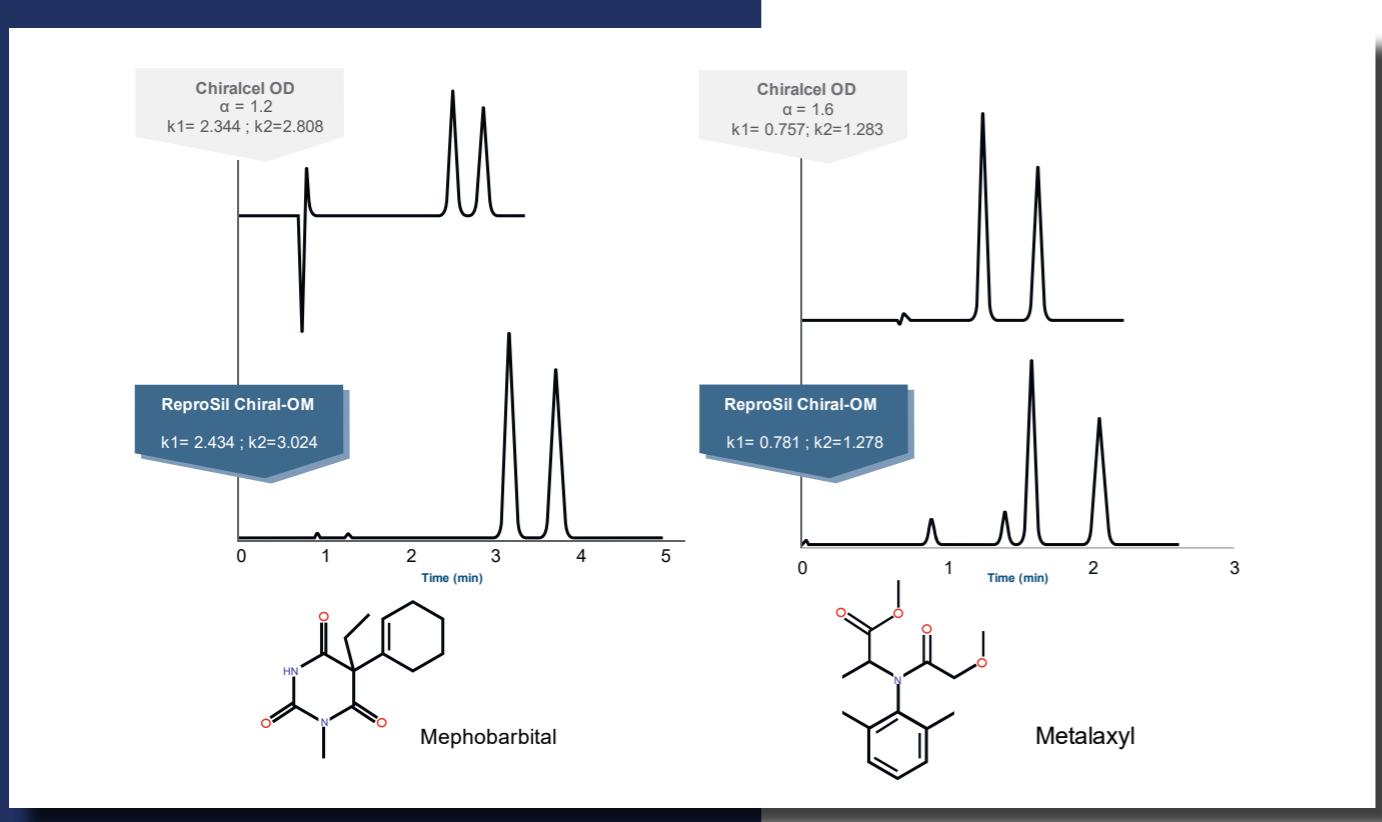

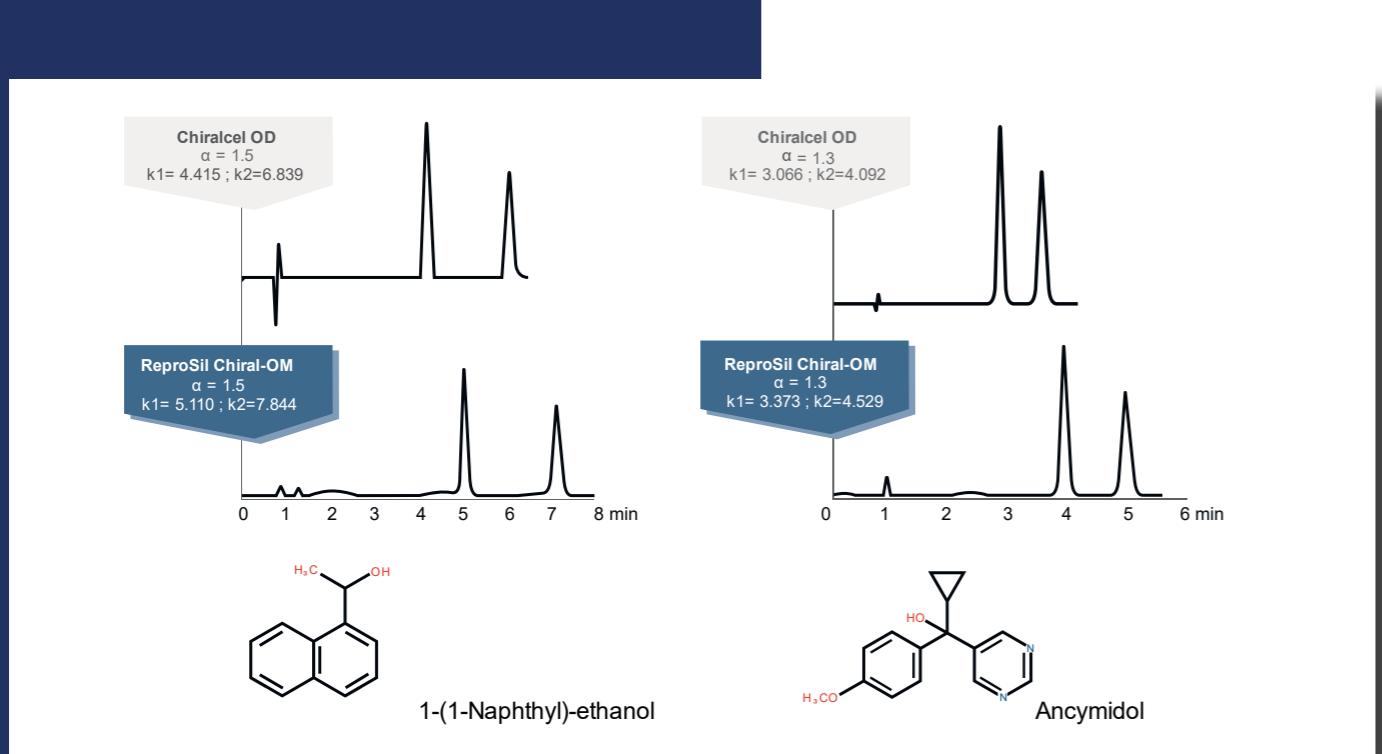

The following chromatograms illustrate the complementary of the generic phases having cellulose tris-(3,5- dimethylphenyl-carbamate) as chiral selector in the course of method development: Focus on ReproSil Chiral-OM versus Chiralcel OD The chromatograms illustrate the chiral compounds that are well resolved on ReproSil Chiral-OM (a) but have no separation on Chiralcel OD (b).

(2,3-epoxypropyl)-benzene

IDENTICAL SELECTIVITY

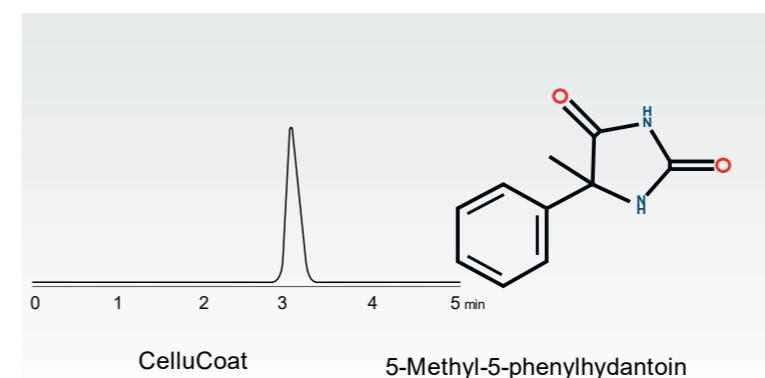

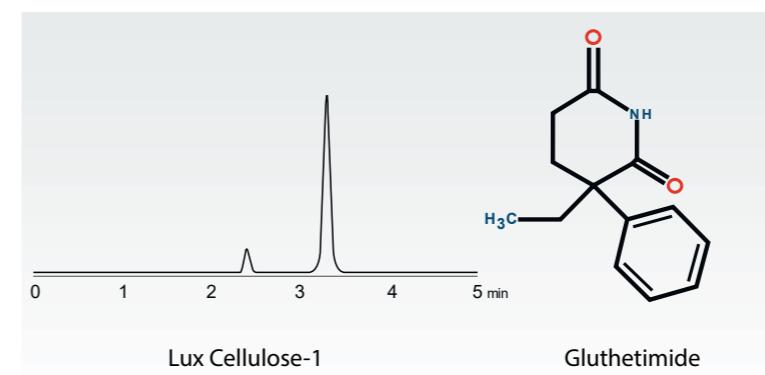

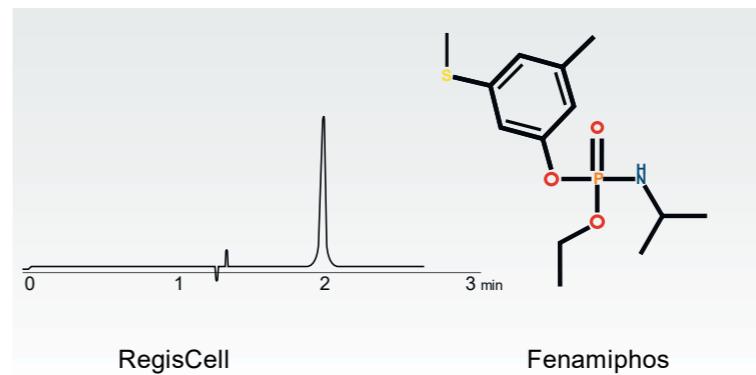

COMPARISON OF REPROSIL CHIRAL OM AND CHIRACEL OD

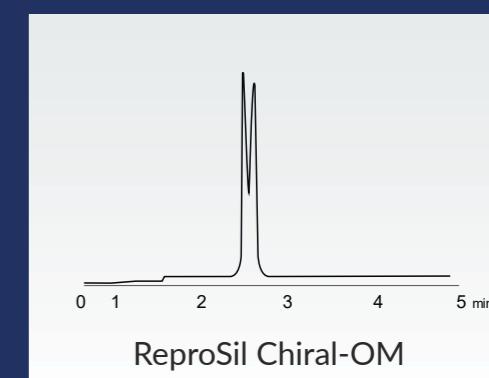

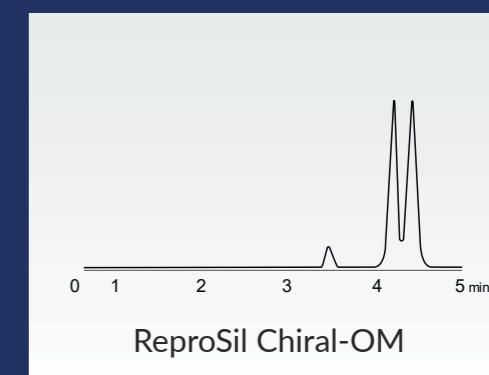

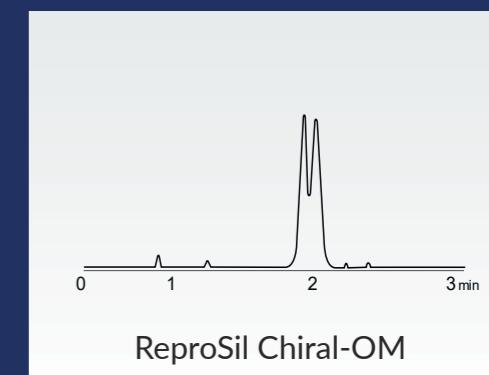

COMPARISON OF USP-L40 CHIRAL COLUMNS

The analysis of fenamiphos, glutethimide and 5-methyl-5-phenylhydantoin on ReproSil Chiral-OM provide a better starting point for a method development than those on RegisCell, Lux Cellulose-1 or Cellucoat, respectively.

NO SEPARATION

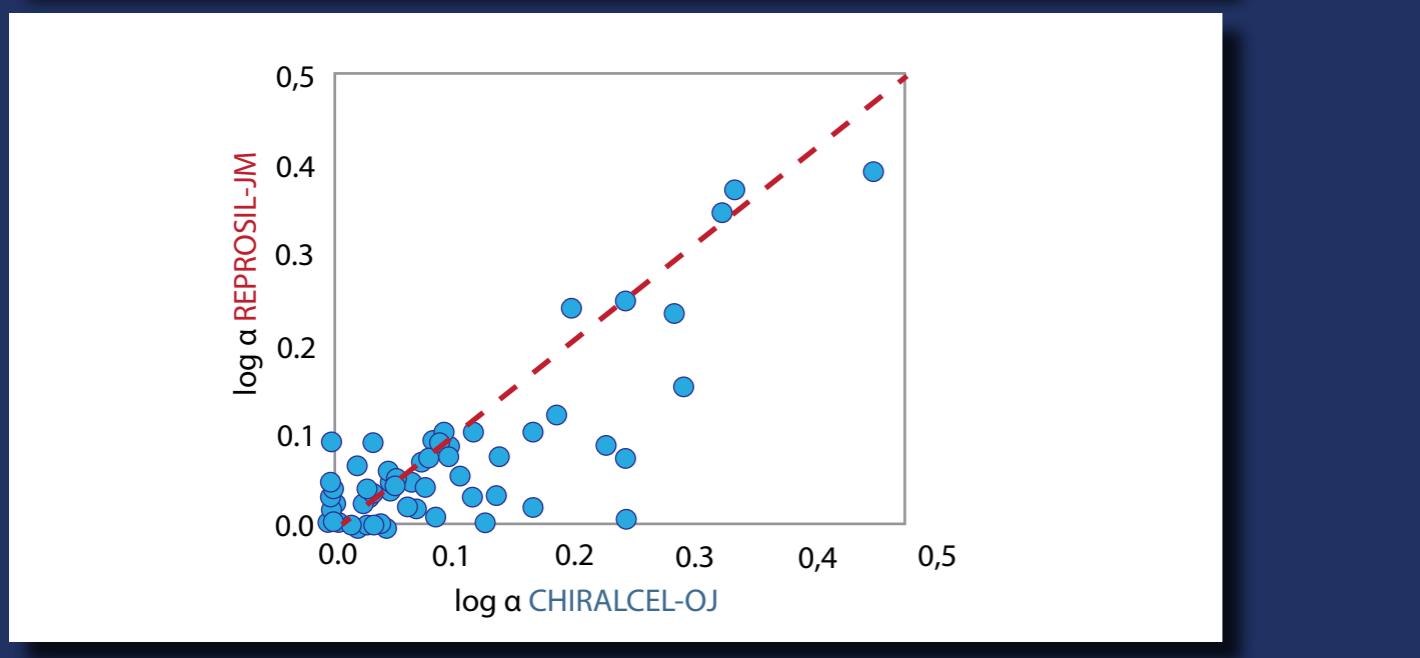

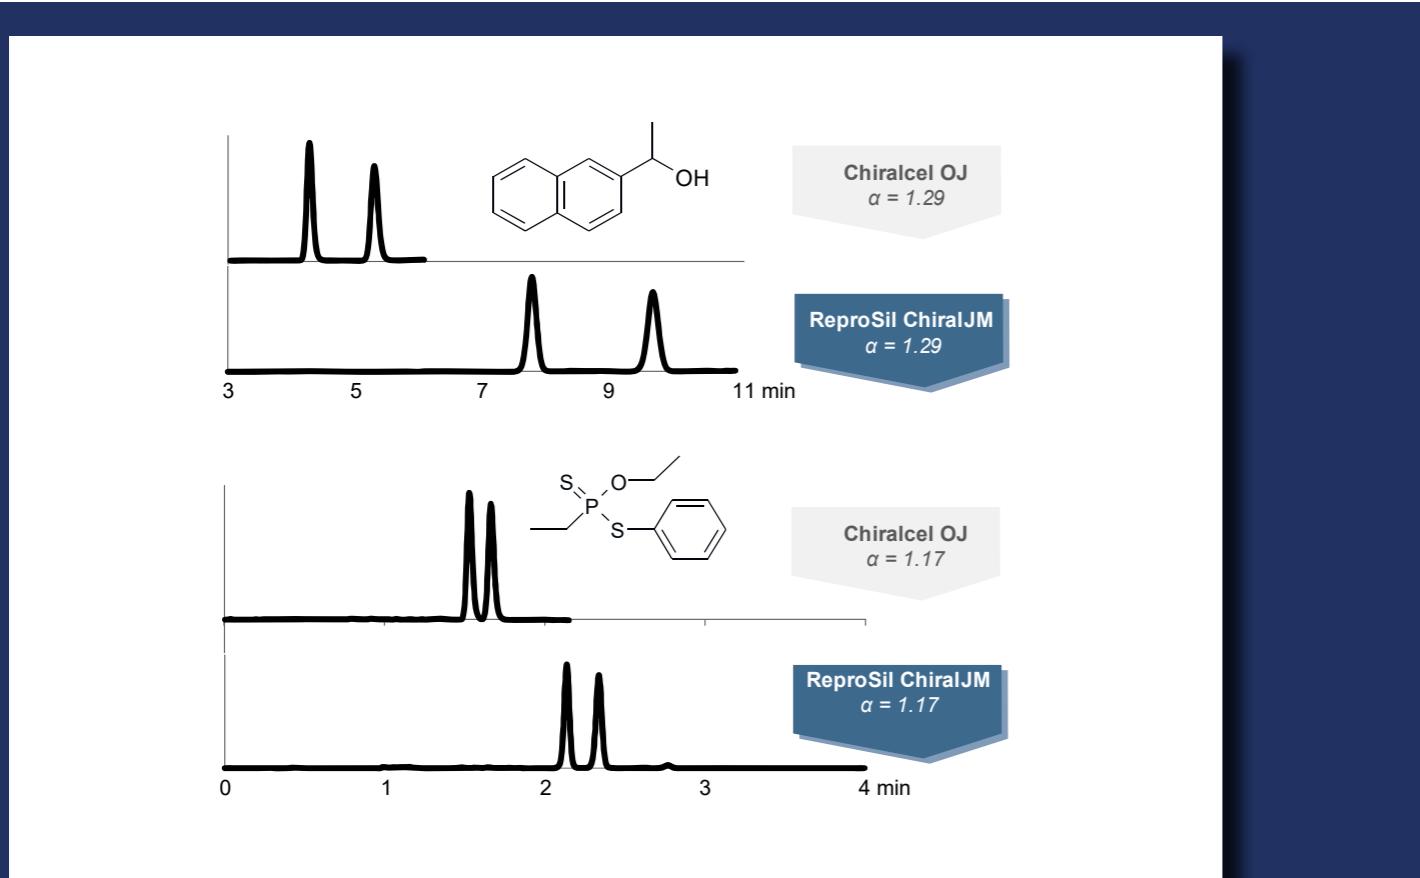

SEPARATION

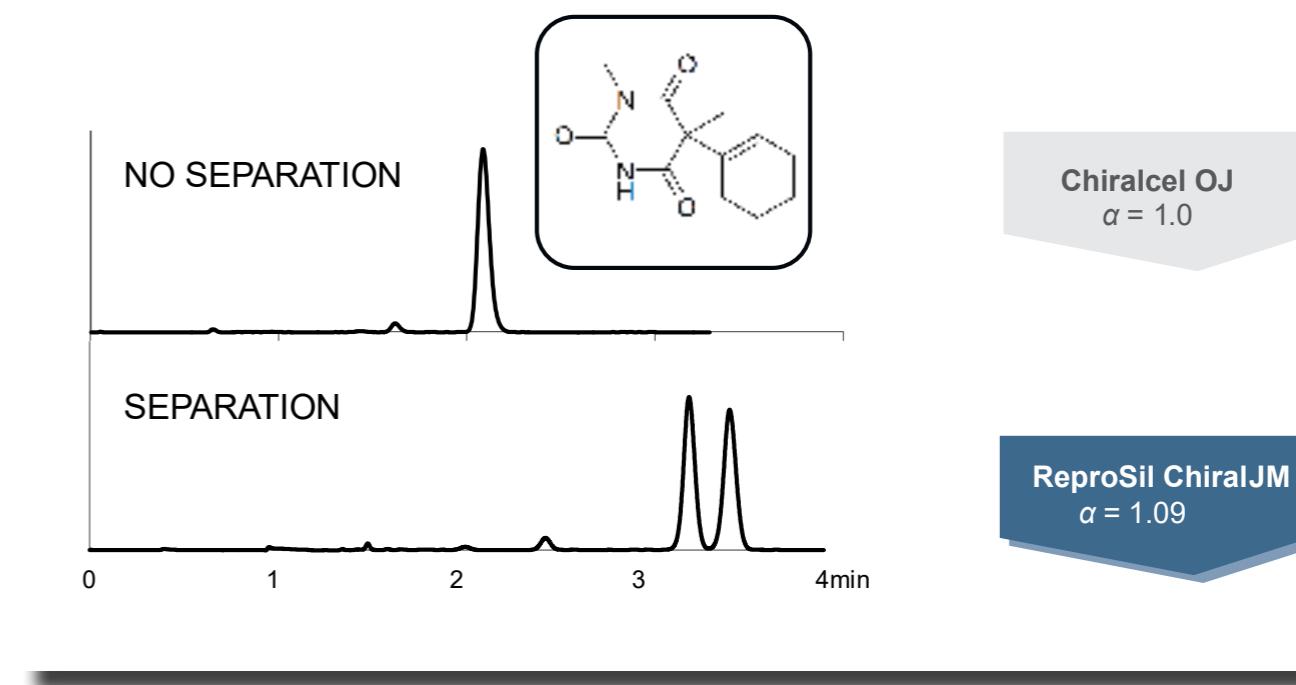

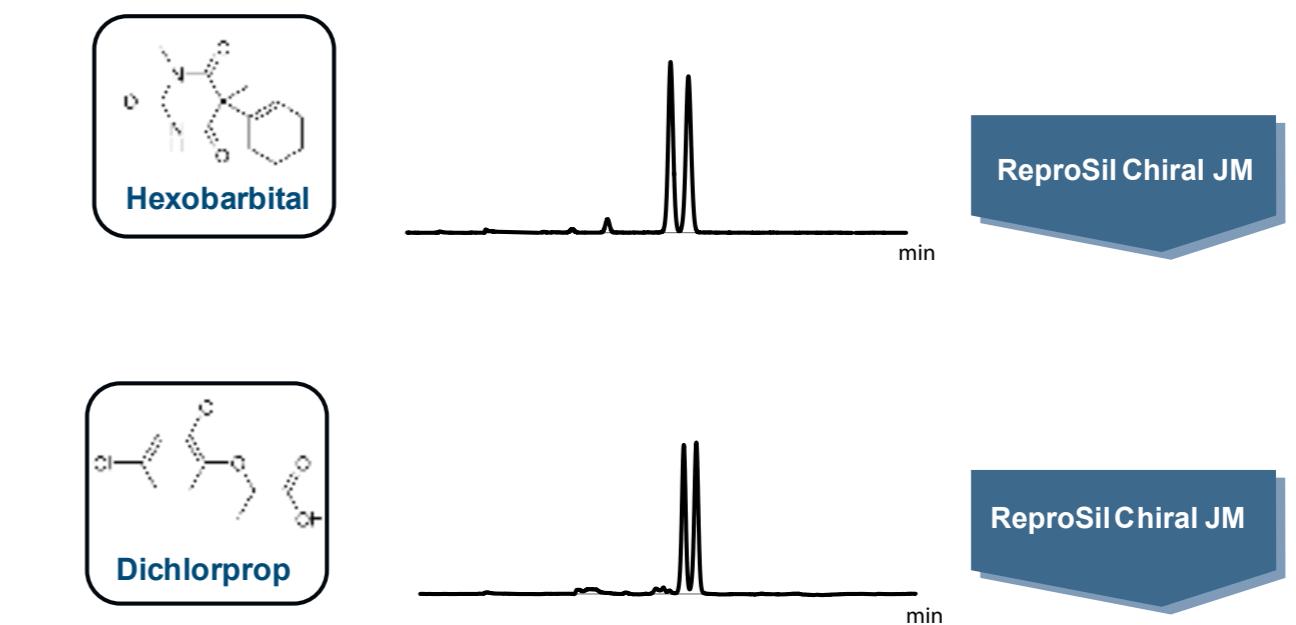

SELECTIVITY OF JM vs. OJ (USP-L80)

The log α - log α plot compares the selectivities ability of JM and OJ.

The data points located on the first bisector (red dotted line) show similar separation profiles. The chromatograms of 1-(2-Naphthyl)-ethanol and Fonofos illustrate chiral compounds with identical separation factors on both columns.

The analysis of Hexobarbital on ReproSil Chiral-JM provides a better starting point for a method development than those on Chiral-AM or Chiral-OM.

Comparison of unique immobilised ReproSil Chiral phases with competitor's coated equivalents in NP and PO mode

ReproSil Chiral MIX vs. Lux Cellulose-4 under NP/PO conditions

Customer sample
No additives used
Black: Lux Cellulose 4
Colour: ReproSil Chiral MIX

REPROSIL CHIRAL – TYPICAL MOBILE PHASE CONDITIONS

Normal Phase

- Mixtures of hexane or heptane with alcohols (EtOH, IPA) = 80:20 (vary % alcohol to adjust retention time and selectivity)
- Add 0.1 – 0.5% DEA or TEA for basic analytes and 0.1 – 0.5 % TFA or AcOH for acidic analytes

Polar Organic Phase

- Mixtures of ACN / IPA (95/5) or MeOH / IPA (90/10) or neat ACN
- Add 0.1 – 0.5% DEA or TEA for basic analytes and 0.1 – 0.5 % TFA or AcOH for acidic analytes

Reversed Phase

- ACN or MeOH or EtOH / water mixtures
- Water content must be < 85%
- Add 0.5 – 1 N perchlorate or 0.1% TFA for basic compounds and HClO₄/NaClO₄ buffer for acidic compounds together with ACN
- Use dedicated column for reversed phase conditions because solvent switch is tedious

Solvent compatibility of coated phases

As the polysaccharide layer is not chemically bonded to the silica support but physically adsorbed, strong solvents have the ability to strip the polymer off the silica support and have therefore to be avoided even in trace amounts or as an injection solvent. Such strong solvents include:

- | | |
|--|---|
| <ul style="list-style-type: none"> Ethers incl. THF Acetone Chlorinated solvents Ethyl acetate DMSO | <ul style="list-style-type: none"> DMF Toluene Ketones Dimethylacetamid IPA > 50% |
|--|---|

With immobilised phases an extended range of organic solvents can be used as injection solvents and eluents.

Recommended temperature range: 0 – 40°C

Recommended max. pressure: 150 bar

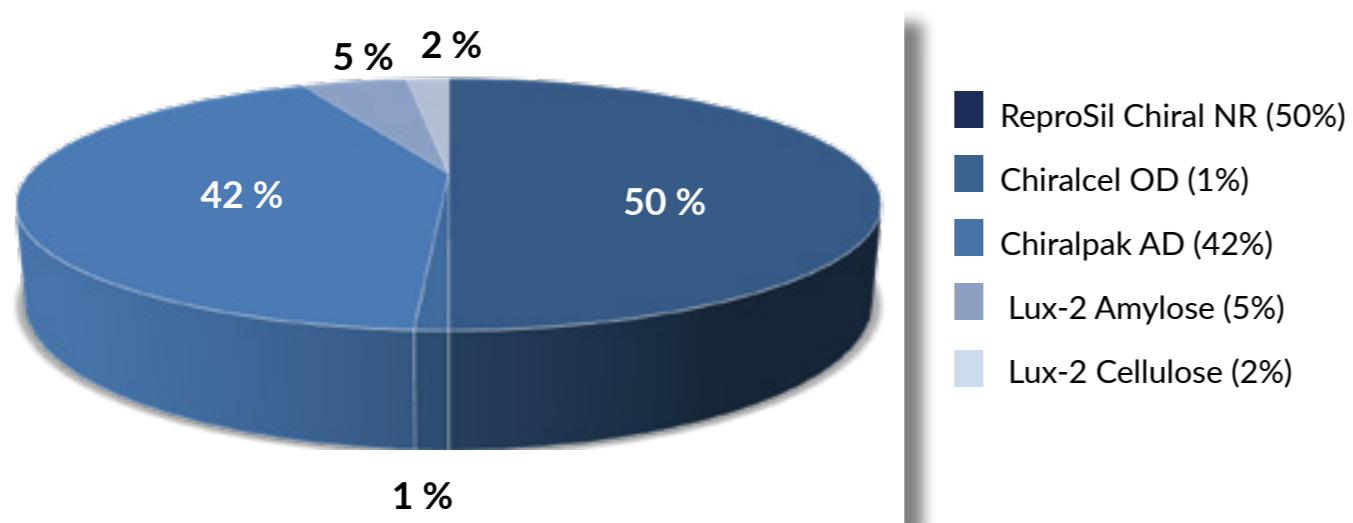

ReproSil Chiral NR – unique chemically bonded phase

- Immobilised brush-type phase
- Dinitro compound, acceptor and electron donor phase
- Particularly useful for aromatic compounds with O or N near chiral centre
- NR, RP, SFC mode
- Both antipodes of chiral selector available - elution order reversible

Why ReproSil Chiral NR?

- switch from **NP** to **RP** within minutes
- In all common HPLC eluents chemically stable
- amenable to various separation modes and solvents
- scalable
- complementary selectivity
- elution order reversible

ReproSil L-Hydroxy-Prolin, 5 µm Alternative to Nucleosil Chiral-1, USP-L32

Ligand exchange, Eluent: 2-10 mM Coppersulfate,
20-60 C° (For DL-Atrolactinacid, DL-Mandelic acids,
DL-Lactic acid, DL-Asparagin, DL-Serin, DL-Phenylalanin,
DL-Threonin, DL-Prolin, DL-Histidin, DL-Valin,
DL-Tyrosin, DL-Tryptophan),
250 x 4.0 mm (PN: r15.hp.s2504)

ReproSil Chiral-AGP, 5 µm 300 Å Silicagel with chiral AGP-Protein, USP-L41

100 x 4.0 mm	(PN: r35.agp.s1004)	150 x 2.0 mm	(PN: r35.agp.s1502)
150 x 3.0 mm	(PN: r35.agp.s1503)	100 x 2.0 mm	(PN: r35.agp.s1002)
100 x 3.0 mm	(PN: r35.agp.s1003)	50 x 2.0 mm	(PN: r35.agp.s0502)
50 x 3.0 mm	(PN: r35.agp.s0503)		
Guards: 5 x 3.0 mm: 2 pieces	(PN: r35.agp.v0003)	Guards: 5 x 2.0 mm: 2 pieces	(PN: r35.agp.v0002)
Guard-holder, direct	(PN: 81.00)	Guard-holder, direct	(PN: 91.00)
